

Preseem Essentials

For ISPs who want to investigate, understand and improve their subscriber quality of experience.

Preseem has always been able to tell ISPs where and when QoE issues on their network were happening. With **Preseem Essentials**, you'll get a much deeper view into your RF network across equipment from different vendors. This information, combined with our insightful QoE metrics and a generous two-year metric retention time, makes it much faster to identify the root cause of subscriber problems and when an issue began.

With our new CPE Radio Metrics, your team will be able to investigate QoE problems more efficiently. With Preseem Essentials, you can:

Easily **identify the source of QoE problems and any RF changes** with universal, vendor-specific, and summary metrics.

View the history of an RF connection over time when diagnosing issues. You can validate that RF quality is the same as at installation, identify when and why it may have changed, and assess subscriber RF issues on a support call.

Compare installations done by different technicians and **determine whether an install meets the requirements.**

Get a better understanding of what's happening on your fixed wireless network, while improving subscriber QoE and reducing latency, support calls, and operational costs.

**Everything you need
in one place.**
